Understanding Basic Concepts of Area

What is Area?

Area refers to the amount of surface covered by a two-dimensional shape. It is measured in square units such as square centimeters (cm²), square meters (m²), or square inches (in²). Calculating the area allows us to determine how much space a shape occupies.

Importance of Area in Real Life

Understanding area calculations helps in various fields such as:

- Architecture and construction (flooring, wall painting)
- Agriculture (farming land measurement)
- Interior design (carpet or tile coverage)
- Art and design (canvas or paper sizes)

Area of Basic Shapes: Rectangles, Squares, and Parallelograms

Rectangle

- Formula: $\text{Area} = \text{length} \times \text{width}$
- Properties: Opposite sides are equal, and angles are right angles.
- Notation: If length = L and width = W, then $\text{Area} = L \times W$.

Square

- Formula: $\text{Area} = \text{side} \times \text{side} = \text{side}^2$
- Properties: All sides are equal, and angles are right angles.
- Note: The square is a special case of a rectangle.

Parallelogram

- Formula: $\text{Area} = \text{base} \times \text{height}$

- Determining the size of tiles required for a square floor.

Word Problems Involving Parallelograms

Parallelograms have a more complex area formula involving base and height. Their word problems often include scenarios where height is not directly given, requiring the use of auxiliary data or geometric reasoning.

Common Types of Parallelogram Area Problems

- Calculating area when base and height are known
- Finding missing height or base when the area and other dimensions are given
- Using diagonal and side lengths to find area

Key Concepts for Parallelogram Problems

- The height is perpendicular to the base, not necessarily the side length.
- Sometimes, the problem involves the use of other properties, such as diagonals or angles.

Sample Problems and Solutions

Problem 5: A parallelogram has a base of 15 meters and a height of 8 meters. Find its area.

Solution:

- $\text{Area} = \text{base} \times \text{height}$
- $\text{Area} = 15 \times 8 = 120$ square meters

Problem 6: The area of a parallelogram is 180 square meters, and the base length is 12 meters. Find the height.

Solution:

- $\text{height} = \frac{\text{Area}}{\text{base}}$
- $\text{height} = \frac{180}{12} = 15$ meters

Problem 7: In a parallelogram, if the side length is 10 meters and the height is 6 meters, what is the area? (Assume the side length is the base.)

Solution:

- $\text{Area} = \text{base} \times \text{height} = 10 \times 6 = 60$ square meters

Advanced Word Problems and Real-World Applications

Real-life scenarios often involve combining multiple shapes and dimensions, requiring critical thinking and multi-step calculations.

Examples of Complex Word Problems

Example 1: A rectangular garden measures 50 meters in length and 30 meters in width. A path of uniform width surrounds the garden, increasing its total area to 2,500 square meters. Find the width of the path.

Solution Approach:

- Let w be the width of the path.
- Total dimensions including the path: $(50 + 2w)$ and $(30 + 2w)$.
- Set up the equation: $(50 + 2w)(30 + 2w) = 2500$.
- Expand and solve the quadratic:

\[

$$(50 + 2w)(30 + 2w) = 2500$$

\]

\[

$$1500 + 100w + 60w + 4w^2 = 2500$$

\]

\[

$$4w^2 + 160w + 1500 = 2500$$

\]

\[

$$4w^2 + 160w - 1000 = 0$$

\]

- Divide through by 4:

\[

$$w^2 + 40w - 250 = 0$$

\]

- Use quadratic formula:

\[

$$w = \frac{-40 \pm \sqrt{40^2 - 4 \times 1 \times (-250)}}{2}$$

\]

$$w = \frac{-40 \pm \sqrt{1600 + 1000}}{2} = \frac{-40 \pm \sqrt{2600}}{2}$$

- Approximate:

$$\sqrt{2600} \approx 50.99$$

- Possible solutions:

$$w = \frac{-40 + 50.99}{2} \approx \frac{10.99}{2} \approx 5.495$$

$$w = \frac{-40 - 50.99}{2} \approx \frac{-90.99}{2}$$

QuestionAnswer How do you find the area of a rectangle with length 8 meters and width 5 meters? Multiply the length by the width: $8 \times 5 = 40$ square meters. A square has a perimeter of 36 meters. What is its area? First, find the side length: $36 \div 4 = 9$ meters. Then, area = $9 \times 9 = 81$ square meters. If the base of a parallelogram is 10 cm and the height is 7 cm, what is its area? Area = base $\times$ height = $10 \times 7 = 70$ square centimeters. A rectangle's length is twice its width. If the area is 48 square meters, what are the dimensions? Let width = w , then length = $2w$. Area = $w \times 2w = 2w^2 = 48$. So, $w^2 = 24$, $w \approx 4.9$ meters. Length ≈ 9.8 meters. How do you determine the area of a parallelogram given the diagonals and the angle between them? Use the formula: Area = $\frac{1}{2} \times d_1 \times d_2 \times \sin(\text{angle between diagonals})$. What is the area of a square with a diagonal length of $10\sqrt{2}$ cm? Diagonal = $s\sqrt{2}$, so $s = \text{diagonal} / \sqrt{2} = 10\sqrt{2} / \sqrt{2} = 10$ cm. Area = $s^2 = 10 \times 10 = 100$ square centimeters. A rectangle has a length of 15 meters and an area of 150 square meters. What is its width? Width = area $\div$ length = $150 \div 15 = 10$ meters. How do you find the area of a rhombus if you know the lengths of its diagonals? Area = $\frac{1}{2} \times d_1 \times d_2$, where d_1 and d_2 are the diagonals. In a

parallelogram, if the base is 12 cm and the height is 9 cm, what is its area? $\text{Area} = \text{base} \times \text{height} = 12 \times 9 = 108$ square centimeters.
